DHC

DHC Corporation collaboration

TOYO INK's delamination recycling technology has enabled the recovery of DHC's aluminum supplement pouches as a recyclable resource.

DHC uses aluminum-foil laminate pouches to protect its granular supplements from light, oxygen and moisture. The foil and plastic films are bonded together, making them difficult to separate and recycle after use.

The joint study tested delamination, reprocessing, physical properties and packaging suitability and confirmed the material can be reused in pouches at a practical level.
